The global Mag Particle Inspection Service market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Magnetic Particle Inspection (MPI) is a non-destructive testing method used to detect surface and near-surface defects in ferromagnetic materials. It is commonly used in industries such as aerospace, automotive, oil and gas, and manufacturing.

Mag Particle Inspection Service refers to the professional service provided by companies or individuals who specialize in performing magnetic particle inspections. These service providers have the expertise, equipment, and knowledge to conduct the inspection process accurately and efficiently.

During the inspection, a magnetic field is applied to the material being tested, and a magnetic particle suspension (usually a fine iron powder) is applied to the surface. If there are any defects or cracks present, the magnetic particles will be attracted to these areas, forming visible indications. These indications can then be analyzed and evaluated to determine the severity and nature of the defects.

Mag Particle Inspection Service providers typically offer on-site inspections, where they bring the necessary equipment to the client's location, or they may have a dedicated facility where inspections can be conducted. They may also provide additional services such as reporting, analysis, and recommendations for repair or further testing.

United States market for Mag Particle Inspection Service is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
