A Maglev rotation system utilizes magnetic levitation to rotate an object without physical contact. This system typically consists of two main components: a stationary base and a rotating element. The stationary base contains electromagnets or permanent magnets arranged in a specific configuration to create a magnetic field. The rotating element, often a rotor or a disk, is equipped with magnets that interact with the magnetic field generated by the base.

The global Maglev Wafer Rotation System market size is projected to grow from US\$ 54.8 million in 2024 to US\$ 112 million in 2030; it is expected to grow at a CAGR of 12.7% from 2024 to 2030.
