The global Magnesium Aluminum Hydrotalcite market size is predicted to grow from US\$ 189 million in 2025 to US\$ 260 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Magnesium aluminum hydrotalcite is a type of anionic layered functional inorganic material with a layered structure, adjustable chemical composition, and unique structure and properties. When applied to PVC resins, the anion layer can undergo an exchange reaction with the free radical chlorine generated during the degradation process of PVC, stabilizing the chlorine free radicals between the layers and blocking further degradation reactions.

With the continuous advancement of production technology, the production cost of magnesium aluminum hydrotalcite is expected to gradually decrease, and its performance will also be further improved. In the context of increasingly high environmental requirements, the green application of magnesium aluminum hydrotalcite will become an important trend for future development, especially in wastewater treatment and pollutant removal. In addition to traditional catalysts and environmental protection fields, the application of magnesium aluminum hydrotalcite in multiple industries such as new energy, medicine, and food will continue to expand, with broad market prospects.
