The global Magnetic Beads for Protein and Antibody Purification market size is predicted to grow from US\$ 373 million in 2025 to US\$ 596 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Magnetic beads for protein and antibody purification are a type of surface functionalized magnetic particle material, usually composed of a magnetic core (such as iron oxide) and an outer polymer or agarose matrix. Their surface is fixed with specific ligands (such as Protein A, Protein G, Ni NTA, Streptavidin, etc.), which can selectively bind to target proteins or antibodies through specific affinity interactions, and achieve rapid separation and elution under the action of an external magnetic field; This technology does not require centrifugation or chromatography column operations, and has the characteristics of high efficiency, strong repeatability, and easy automation. It is a key separation tool in proteomics research and biopharmaceutical production. In 2025, global Magnetic Beads for Protein and Antibody Purification production reached approximately 6,567 ML, with an average global market price of around US\$ 58 per ML.

In molecular biology, magnetic beads provide a simple and reliable method for purifying various types of biological molecules, including genomic DNA, plasmids, mitochondrial DNA, RNA, and proteins. The advantage of using magnetic beads is that it eliminates the steps of centrifugation or filtration involved in traditional protein purification methods. Magnetic beads are often used as solid phase materials for protein and antibody purification. Magnetic beads are small particles with magnetism, typically composed of magnetic materials such as ferrite and surface modification layers. In the process of protein and antibody purification, magnetic beads can bind to the target protein or antibody through specific affinity or ion exchange ligands, thereby achieving selective separation and purification. Magnetic beads have many advantages in protein and

antibody purification, including high selectivity, high purity, ease of operation, rapid separation, and reusability. Therefore, magnetic beads have become one of the commonly used solid-phase materials in the field of protein and antibody purification.
