The global Magnetic Compound for Injection Molding market size is predicted to grow from US\$ 234 million in 2025 to US\$ 313 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Global sales of Magnetic Compound for Injection Molding was about 6640 tons in 2025 with average price of 36 USD/kg. The average gross margin of the industry ranges from 15%-20%. The core raw materials of Magnetic Compound for Injection Molding are: (1) magnetic powder as the functional phase—most commonly NdFeB (neodymium-iron-boron) powder for higher magnetic strength, or ferrite powder for lower cost and better thermal/corrosion robustness (and in some cases soft-magnetic powders); (2) a thermoplastic polymer binder (e.g., PA/nylon, PPS, PBT, TPU/TPE) that provides melt flow, toughness, and dimensional stability during injection molding; and (3) a small package of additives such as coupling agents/dispersants (to improve powder–resin bonding and uniform dispersion), lubricants/flow modifiers (to enhance mold filling), and stabilizers (heat/oxidation protection), with optional corrosion inhibitors depending on the magnet powder and service environment.

Magnetic Compound for Injection Molding is a pelletized, injection-moldable composite material made by dispersing magnetic powder (typically permanent-magnet powders such as NdFeB or ferrite, or soft-magnetic powders) into a polymer binder (e.g., PA, PPS), plus additives for flow, coupling, stabilization, and processing. It is designed to be processed on standard injection molding machines to form net-shape magnetic parts.
