The global Magnetic Deburring and Polishing Machine market size is predicted to grow from US$ 164 million in 2025 to US$ 252 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Magnetic Deburring and Polishing Machines are surface-finishing machines that use rotating magnetic fields to drive stainless steel needles or magnetic media to remove burrs, polish surfaces, clean edges, and improve surface uniformity on small precision parts. Compared with manual polishing, vibratory finishing, or conventional tumbling, magnetic polishing is especially suitable for small, complex, thin, irregular, or delicate components with holes, slots, grooves, and internal corners. The equipment usually includes a magnetic drive system, work chamber, polishing media, liquid compound circulation, speed control, timer, safety cover, and process-control panel. It is widely used in jewelry, precision hardware, medical parts, electronics, watch components, dental parts, small machined parts, and 3D-printed metal components.The industrial chain of Magnetic Deburring and Polishing Machines includes upstream suppliers of magnetic drive assemblies, motors, frequency converters, stainless steel polishing needles, polishing compounds, tanks, bearings, seals, sensors, control panels, PLC units, cooling devices, corrosion-resistant materials, safety covers, and precision machined parts. The midstream consists of equipment manufacturers that design and assemble magnetic polishing systems, rotating magnetic field modules, processing chambers, media circulation units, speed-control systems, filtration modules, safety devices, and customized fixtures. Downstream users include jewelry manufacturers, precision hardware factories, medical device suppliers, electronics component producers, watch and clock manufacturers, dental laboratories, small metalworking shops, mold component producers, additive manufacturing service providers, and precision parts processors. Supporting services cover process testing, media selection,

installation, maintenance, spare parts supply, and operator training.

The Magnetic Deburring and Polishing Machine market is a specialized segment within surface-finishing and deburring equipment. Its demand is supported by precision hardware, jewelry, medical components, electronics, dental products, watch parts, miniature machined parts, and additive-manufactured metal parts. The technology is attractive because it can reach small holes, internal corners, grooves, and complex surfaces that are difficult to process manually or with conventional tumbling methods. Users adopt these machines to improve surface consistency, reduce manual finishing labor, shorten post-processing time, and improve the appearance and cleanliness of precision parts. The market benefits from miniaturization, higher appearance-quality requirements, and growth in small-batch precision manufacturing. However, the process is not suitable for all part sizes or materials, and performance depends on media selection, magnetic field strength, liquid formulation, part geometry, and process time. Competition from vibratory finishing, centrifugal finishing, abrasive flow machining, and manual polishing remains significant.In 2025, global Magnetic Deburring and Polishing Machine production reached approximately 9.08 thousand units, with an average global market price of around US$18,500 per unit. The gross profit margin of major companies in the industry ranged from 28% to 45%. In 2025, the global production capacity of Magnetic Deburring and Polishing Machines was approximately 12.11 thousand units.
