## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Magnetic Descaler is achieved by introducing a permanent magnet system in the pipeline. Permanent dipoles appear on the metal ions, which can cause repulsive forces between the metal ions (and other charged or polar substances) and the surface of the pipe or water equipment. In this way, the magnetic force changes the physical molecular structure that leads to the formation of scale, and uses composite ripples to change the conditions of the surrounding environment to break up the bonds between ions and make them synthesize stable non-scale substances. Magnetic effects can further effectively influence the fluid passing through the magnetic region.
