Magnetic Flux Leakage Inspection Systems is a non-destructive testing technology used to detect defects in metallic materials. This system uses the principle of electromagnetic induction to detect magnetic abnormal areas in the material by applying a magnetic field to the surface of the material being tested. When there are defects on the material surface (such as cracks, corrosion, etc.), the magnetic field will leak, resulting in abnormal signals.

Magnetic Flux Leakage Inspection Systems mainly consists of magnetic field generation device, sensor, data acquisition and processing equipment. Magnetic field generating devices usually use permanent magnets or electromagnets to generate a uniform magnetic field. The sensor is used to detect magnetic field leakage signals and convert the signals into electrical signals for transmission to data acquisition and processing equipment. Data acquisition and processing equipment analyzes and processes the signals collected by the sensors, and finally generates defect images or reports.

The global Magnetic Flux Leakage Inspection Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
