## Abstracts

The global Magnetic Flux Leakage Testing Equipment market size is predicted to grow from US\$ 271 million in 2025 to US\$ 433 million in 2031; it is expected to grow at a CAGR of 8.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Magnetic flux leakage detection equipment is a non-destructive testing instrument based on the principle of magnetic field change. It is mainly used to detect surface or near-surface defects (such as cracks, corrosion, wear, etc.) of ferromagnetic materials (such as steel pipes, storage tanks, steel structures, etc.). Its core principle is to apply a strong magnetic field to the object being tested through a magnetizer. When there are defects in the material, the magnetic lines of force will be distorted at the defect and form a leakage magnetic field. The equipment captures the leakage magnetic field signal through a high-sensitivity sensor (such as a Hall effect sensor or a magnetoresistive sensor), and combines the data acquisition system and analysis software to achieve the location, identification and quantitative evaluation of defects. The equipment has the characteristics of non-contact, high efficiency, and automated operation. It is widely used in oil and gas pipelines, power equipment, aerospace, new energy and other fields. It is an important tool to ensure the safety of industrial structures. This report studies the equipment used for direct magnetic flux leakage detection, including small portable equipment (magnetic flux leakage detector) and large desktop magnetic flux leakage detection equipment.
