The global Magnetic Gear Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Magnetic Gear Machine is a new type of dual-rotor permanent magnet motor. MGM is composed of magnetic field modulation type magnetic gear and traditional permanent magnet synchronous motor in structure. It can be divided into many different topological types according to different compounding methods. Due to the introduction of magnetic field pole changing and deceleration effect of magnetic gear, magnetic gear compound motor can be regarded as a motor system with a reducer, which can multiply the output torque of permanent magnet motor and achieve a significant increase in torque density. Magnetic gear compound motor has small leakage flux and power factor similar to conventional permanent magnet motor, which is much higher than vernier motor, so it is more suitable for large load occasions.

With the continuous deepening of the research on the structure and principle of magnetic gear compound motor, and the introduction of some traditional motor structures and analysis methods, the performance and application fields of MGM have been expanded. At present, MGM has shown good application prospects in the fields of electric transportation drive, new energy power generation, power distribution, petrochemical industry, etc., and has become one of the research hotspots in the field of motors.

United States market for Magnetic Gear Machine is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
