The global Magnetic Induction Knock Sensor market size is predicted to grow from US$ 554 million in 2025 to US$ 720 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

A magnetic induction knock sensor is a device used in internal combustion engines to detect engine knocking. It operates based on the principle of magnetic induction. When the engine cylinder undergoes knocking vibrations, these vibrations cause changes in the magnetic field around the sensor. The sensor then converts these magnetic field changes into electrical signals that can be recognized by the engine control unit (ECU). By analyzing these electrical signals, the ECU can determine whether knocking has occurred and the intensity of the knocking, and then make corresponding adjustments to the ignition timing and fuel injection to prevent or reduce knocking, thereby ensuring the normal operation of the engine, improving its efficiency and reducing wear and tear.

United States market for Magnetic Induction Knock Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Magnetic Induction Knock Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
