The magneto-inductive speed sensor is a sensor that uses the principle of magneto-induction to measure the speed of an object. It determines speed by detecting changes in the magnetic field produced when an object moves. Such sensors typically consist of a generator that emits a magnetic field and a receiver that detects changes in the magnetic field. When an object moves, its position relative to the sensor causes changes in the magnetic field, and the sensor can measure this change to calculate the object's speed. Magnetically inductive speed sensors are commonly used in industrial automation, vehicle navigation, and other applications that require precise speed measurement.

The global Magnetic Inductive Velocity Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
