Magnetic leakage testing (MFL) is one of the commonly used surface defect detection methods for ferromagnetic material products. It is an electromagnetic non-destructive testing method used to detect surface corrosion, pits, grooves, cracks, and other defects of ferromagnetic materials. It has been widely used in the detection of large atmospheric pressure storage tanks, pressure pipelines, components, and steel wire ropes. Magnetic flux leakage detector is a non-destructive testing equipment used to detect surface or near surface defects of metal materials. It helps identify potential defects or damages by measuring changes in the magnetic field, ensuring the safety and normal operation of the equipment. The magnetic leakage detector for storage tanks and pipelines is mainly used to detect defects such as corrosion, cracks, and wall thickness reduction in ferromagnetic materials such as tank bottom plates and pipelines. The principle is based on magnetizing the measured object and capturing the leakage magnetic field signal through sensors, and then analyzing the location and size of defects.
