The global Magnetic Levitation Bearingless Pump for Semiconductor market size is predicted to grow from US\$ 121 million in 2025 to US\$ 214 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

A Magnetic Levitation Bearingless Pump (MLBP) is an advanced fluid-handling system specifically designed for ultra-clean and high-precision applications in the semiconductor industry. It utilizes active magnetic levitation (maglev) technology to suspend and rotate the impeller without physical contact, eliminating the need for traditional mechanical bearings, seals, or lubrication.

Magnetic levitation pumps integrated with bearingless motor technology are revolutionizing fluid handling in semiconductor manufacturing by offering precise, pulsation-free fluid flow with 5-degree-of-freedom suspension control. These pumps address the limitations of traditional diaphragm or bellows pumps, particularly in ultra-clean applications like chemical mechanical polishing (CMP) and wet cleaning, where zero-particulate fluid delivery is critical. Constructed with high-purity fluoropolymers and protective polymer layers, they resist corrosion and handle aggressive chemicals safely. Initially adopted in semiconductor manufacturing, these pumps are gaining traction in solar cell and flat panel display production, where similarly stringent cleanliness standards apply. Their frictionless, particle-free operation minimizes contamination risks, aligning with rigorous industry standards like SEMI F57, and their precise electronic speed regulation enhances process stability and manufacturing yields. Additionally, the extended service life and maintenance-free nature of these pumps help reduce downtime and operational costs, making them a valuable investment for manufacturers seeking improved efficiency and productivity.
