Magnetic loss type absorbing material is a special absorbing material, which is mainly defined by absorbing electromagnetic waves by appropriate magnetic permeability. Specifically, magnetic loss type absorbing material uses the magnetic components filled in the material as absorbents of lossy electromagnetic waves, such as the most traditional ferrite. Under the action of an external electric field, natural resonance and hysteresis phenomena will occur inside the material, thereby losing electromagnetic waves. This material usually has a high saturation magnetization and easy to adjust electromagnetic parameters, so it has always been a research hotspot. Its main magnetic loss mechanisms include hysteresis loss, domain wall resonance loss, eddy current loss and natural resonance loss.

The global Magnetic Loss Type Absorbing Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
