## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A magnetic pick-up coil sensor is a sensor used to detect the position and movement of magnetic objects. It works using the principle of magnetic field induction. Typically, a sensor consists of a coil that detects the position and movement of a target object through changes in the magnetic field around the coil. When the target object approaches or moves away from the sensor, changes in the magnetic field cause voltage signals to be induced in the sensor, and the sensor can determine the position, speed and direction of motion of the target object based on these signals.
