Magnetic surface temperature sensor is a temperature sensor used to measure surface temperature without direct contact. This type of sensor detects temperature changes by using a magnetic field. Sensors typically consist of small magnets and temperature sensitive components, such as thermocouples or resistance temperature detectors

(RTDs). The magnet is placed on the surface of the temperature to be measured, and the temperature sensitive element is located nearby. As the surface temperature changes, it will cause corresponding changes in the magnetic field, detected by temperature sensitive components. Then, this change in the magnetic field is converted into an electrical signal that can be read and interpreted by computers or other devices. Magnetic surface temperature sensors are commonly used in industrial applications, where direct contact with the measured surface is difficult or impractical. They are also useful in situations of surface movement or vibration, as they do not require physical contact to measure temperature.
