Magneto-plumbite ferrite is a ferrite material with strong magnetocrystalline anisotropy. Magneto-plumbite ferrite belongs to the hexagonal crystal system and has a complex crystal structure. It can be subdivided into M, W, X, Y, Z, U and other types. The difference between these types lies mainly in the number of stacking repetitions of oxygen ion dense layers and the number of barium-containing occurrences.

Magneto-plumbite ferrite has a higher natural resonance frequency due to its higher magnetic anisotropy equivalent field and can usually be used as an absorber in the centimeter or millimeter wave band. In addition, it can be further widened by doping other substances. Magneto-plumbite ferrite is a hard magnetic material, that is, after the external magnetic field is removed, the directions of the magnetic domains can still be well consistent, and the object has a strong remanent magnetism.

As a basic functional material, magneto-plumbite ferrite has been widely used in electronics, communications, energy and other fields, such as permanent magnets, gyromagnetism, magnetic recording and ultra-high frequency soft magnetic materials.

The global Magneto-Plumbite Ferrite market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
