Abstracts

The global Magnetoresistive Random Access Memory (MRAM) ICs market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Magnetoresistive Random Access Memory (MRAM) is a type of non-volatile memory that uses magnetic properties to store and retrieve data. MRAM ICs use magnetic materials to store data as magnetic states, which can be read as changes in electrical resistance.

Unlike other types of non-volatile memories such as flash memory, MRAM does not require power to retain data and is faster, more durable, and consumes less power than other memory types. MRAM ICs are commonly used in applications that require high-speed, low-power, and reliable data storage such as mobile devices, automotive, aerospace, and industrial applications.

There are different types of MRAM ICs available such as spin-transfer torque MRAM (STT-MRAM), toggle MRAM (T-MRAM), and magnetic tunnel junction MRAM (MTJ-MRAM). These types differ in their underlying magnetic mechanisms, performance characteristics, and manufacturing processes.

According to our Semiconductor Research Center, in 2022, the global semiconductor equipment was valued at US$ 109 billion. China mainland, China Taiwan and South Korea have a combined market share over 70%. North America, Europe and Japan, have a combined market share of 23%. The key drivers are high performance computing, AI, cloud computing, Servers, 5G and EV (electric vehicle), etc.
