Abstracts

The global Magnetostrictive Alloys market size is predicted to grow from US\$ 189 million in 2025 to US\$ 286 million in 2031; it is expected to grow at a CAGR of 7.2% from 2025 to 2031.

Magnetostriction occurs in materials under applied external magnetic fields, where spontaneous magnetization is aligned with the magnetic field direction and the elastic energy changes because of an interaction between spins, producing ferromagnetism.

GMMs are widely used in actuators and sensors due to their high accuracy and fast response to magnetic fields, making them ideal for precision applications in fields like robotics, aerospace, and industrial automation.

GMMs are used in smart materials and structures that adapt to environmental changes. They are essential in vibration damping, noise reduction, and structural health monitoring in industries like construction, aerospace, and automotive.

The increasing use of GMMs in active vibration control systems, particularly in manufacturing and transportation, is a strong market driver.

GMMs are being explored for their potential in improving the efficiency of renewable energy systems, particularly in wind turbines where vibration control and structural health monitoring are critical.
