The global Main Negative Relay market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The main negative relay is the main relay on the negative side of the circuit, especially in the high-voltage system. It is a type of electromagnetic relay that controls the current in the circuit by triggering the current in the control circuit, thereby controlling the on and off of the current in the main circuit. It contains an electromagnetic coil and a trigger circuit for control. When the current in the control circuit reaches the set condition, the electromagnetic coil is activated, generating a magnetic field, which in turn opens or closes the main contact, thereby achieving control of the current in the main circuit. The working principle of the main negative relay is based on the principle of electromagnetic induction. When the current in the control circuit reaches the set value, the electromagnetic coil is activated and generates a magnetic field. This magnetic field attracts or repels the armature inside the relay, causing the main contact to open or close. In this way, the main negative relay can achieve precise control of the current in the main circuit.
