The global Maize Degermers market size is predicted to grow from US\$ 496 million in 2025 to US\$ 698 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

A maize degermer is a mechanical device specifically designed to separate the germ from the endosperm of corn kernels. It is widely used in the corn deep processing industry chain. Its working principle is typically based on mechanical friction, impact, or centrifugal force. By adjusting the rotation speed, gap, and pressure, efficient degerming is achieved while preserving as much endosperm as possible. Modern maize degermers mostly adopt vertical or horizontal structures, equipped with automatic feeding systems, screening devices, and endosperm recovery systems, suitable for dry or semi-wet processes. The product has an average price of approximately US\$6,200 per unit and global sales of approximately 81,000 units.

The food and beverage industry has been increasingly adopting automation and robotics in equipment and production processes. Automated equipment and robotic systems help improve efficiency, reduce labor costs, increase output, and ensure consistency in food and beverage production. The need for enhanced hygiene and food safety measures has been a significant trend in the food and beverage equipment market. Manufacturers have been focusing on developing equipment with easy-to-clean designs, enhanced sanitation features, and compliance with food safety regulations. Energy efficiency and sustainability have become important considerations in the food and beverage industry. Equipment manufacturers have been developing energy-efficient machines, optimizing processes to reduce waste, and using sustainable materials and technologies in equipment design.
