The global MALDI-TOF MS market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Matrix-assisted laser desorption ionization time-of-flight mass spectrometry, referred to as MALDI-TOF MS in English, is mainly used in the field of clinical microbial identification. It can detect macromolecule biomarkers such as proteins, peptides, oligonucleotides, single nucleotides, and lipids. It is The most representative clinical microbial identification technology at this stage. Since each microorganism is composed of unique proteins, MALDI-TOF MS achieves identification by detecting microbial protein fingerprints. The working principle of MALDI-TOF MS is that biological macromolecule samples and small molecule matrix compounds are mixed in proportion and irradiated with pulse laser. The small molecule matrix absorbs a large amount of laser energy to excite and desorb, ionizing the sample, and the ionized molecules are exposed to the strong electric field It accelerates flight under the influence and enters time-of-flight mass spectrometry for detection.

United States market for MALDI-TOF MS is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
