Cancers that start anywhere in the body’s lymphatic system are called lymphomas. If they have the ability to spread, they are called malignant. The lymphatic system runs throughout our bodies and is composed of lymphoid tissue, vessels, and fluid. Lymphoid tissue contains lymph nodes, which are part of the immune system. The immune system's job is to produce blood cells and protect against harm from invading germs.

The two main types of malignant lymphoma are Hodgkin lymphoma(also known as Hodgkin disease) and NHL. The two types spread in different ways and respond differently to treatment. When lymphomais of a slow-growing variety, it is referred to as low-grade. Aggressive, fast-growing types are called high-grade. A biopsy can also detect the difference between Hodgkin lymphomaand NHL, as well as their various sub-
