Manganese copper shunt is a current measuring device made of manganese copper alloy with excellent low resistance and stable electrical properties. Its working principle is based on Ohm's law, and high-precision current detection is achieved through the tiny voltage drop (usually in the millivolt level) generated by the current flowing through the manganese copper shunt. The core material of manganese copper shunt, manganese copper alloy, has a low temperature coefficient, good oxidation resistance and stable resistance characteristics, and can maintain long-term stable measurement performance in various complex environments.
