The manual slag-discharging disc separator is a type of sedimentation centrifuge, which requires manual removal of the sediment in the drum. During the separation process, the suspension (or emulsion) is added through the feed pipe located in the center of the drum, and the solid particles (or droplets) settle on the disc under the action of centrifugal force to form sediment, which accumulates in the drum. When the sediment accumulates to a certain amount, it is necessary to stop the machine and manually remove the sediment in the drum to achieve continuous or intermittent solid-liquid separation.
