The global Marine Battery Management System market size is predicted to grow from US\$ 1115 million in 2025 to US\$ 1777 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

The marine battery management system (BMS) is an intelligent monitoring and management solution designed for battery packs on ships to ensure safe and efficient operation of batteries. The system monitors battery status parameters such as voltage, current, temperature and state of charge (SOC) in real time, and performs balanced charging, discharge control and thermal management based on these data, thereby extending battery life and improving the reliability and safety of the entire power system. Marine BMS is essential for electric ships or hybrid ships, helping to optimize energy efficiency and ensure navigation safety.

The development trend of marine battery management systems is moving towards higher intelligence, integration and safety. With the rapid growth of the electric ship market and the improvement of environmental protection requirements, the future BMS will integrate more advanced sensor technologies and data analysis algorithms to achieve accurate assessment of battery health status (SOH) and predictive maintenance, further reduce operating costs and improve system reliability. At the same time, in order to meet the needs of ships of different types and sizes, the design of BMS is more modular and flexible, easy to install and expand. In addition, the strengthening of network security functions has also become an important development direction to protect key data from unauthorized access and attacks. Combined with the use of renewable energy, such as solar panels or wind turbines, BMS will also support hybrid energy management and promote the development of ships in a green and sustainable direction. These advances not only improve the performance of ship power systems, but

also provide technical support for promoting the low-carbon transformation of the global shipping industry.
