Abstracts

The global Marine Continuous Emissions Monitoring System market size is predicted to grow from US$ 231 million in 2025 to US$ 467 million in 2032; it is expected to grow at a CAGR of 10.8% from 2026 to 2032.

In 2024, the global market sales volume of Marine Continuous Emissions Monitoring Systems was approximately 3,150 units, with an average unit price of approximately US$68,000 and an industry gross profit margin of approximately 22%–30%. Marine CEMS are online emission monitoring systems used for real-time sampling, drying, dilution, spectral analysis, and data transmission of exhaust gases from ship main engines and boilers. They continuously monitor indicators such as SO?, NO?, CO?, particulate matter (PM), and opacity to meet the reporting requirements of IMO MARPOL Annex VI, EU MRV, FuelEU Maritime, and EU ETS emissions trading. A typical system consists of an extractive or in-situ gas analysis module, a condenser dryer, an ultraviolet/infrared absorption cell, a laser scatterometer, and a data logging and ship-to-shore transmission unit, raw material costs account for approximately 58%–66% of the total system cost. The measurement range is SO? 0–3000 ppm, NO? 0–2500 ppm, and CO? 0–25% vol, with an accuracy of ±1%FS. It supports real-time uploads via the ship-to-shore EUMRV API. A typical 18,000 TEU container ship requires 1–2 CEMS systems per vessel. VLCCs and LNG dual-fuel ships typically use composite measurement units to cover both main engine and boiler power sources. Cruise ships, due to their high load and environmental concerns among passengers, may require 2–4 systems.

United States market for Marine Continuous Emissions Monitoring System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
