A marine drive propeller is a key component installed on a ship to provide propulsion. It is usually driven by the ship's main engine or engine system, converting the engine's mechanical energy into power to propel the ship forward. The design of a marine drive propeller usually has multiple blades, and the angle, shape and number of blades are precisely calculated to provide the best propulsion efficiency. When the propeller rotates, it generates thrust through interaction with the water, pushing the ship to move through the water.
