A Marine Fuel Pump is a vital part of a ship as it determines the performance parameters of a marine diesel engine. This results in adequate automation combined with optimal timing for fuel injection inside the engine. A Marine Fuel Pump controls the volume and timing of fuel injection into the cylinder of an engine. The spring configuration of a Marine Fuel Pump differs for every manufacturer. A Marine Fuel Pump operates based at cam and camshaft location in order to supply all cylinders with a definite amount of fuel at a correct time period depending on the firing order, regardless of the load. The Marine Fuel Pump supplies the injector with a high pressure gas, which then opens the valve to inject atomized fuel into the cylinder against the spring tension. Marine Fuel Pump offer various advantages for smooth engine operations such as reliability powerful acceleration and smooth idling which has envisaged its use in a significant manner.
