A marine hybrid system is a marine propulsion system that combines a traditional internal combustion engine with an electric motor. This system uses a combination of internal combustion and electric motors to propel the ship forward to improve fuel efficiency, reduce emissions and increase navigation flexibility. The main components of a marine hybrid system include an internal combustion engine, a generator, an electric motor, a battery pack, and related control systems. In this type of system, an internal combustion engine is typically used to generate electricity, which is converted into electrical energy by a generator for use by an electric motor. The electric motor directly or indirectly drives the ship's propeller or propeller.

The global Marine Hybrid Drive Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
