The Production is about 450 k units. Marine Mooring System is an integrated mechanical and structural system used to secure vessels or offshore structures in position by resisting environmental loads such as wind, waves, currents and tides. It consists of mooring lines (chains, wire ropes or synthetic ropes), anchors or piles, fairleads and winches, together with monitoring and safety components. Upstream, the system relies on high-strength steel chains, fibre ropes, anchor hardware and hydraulic or electric winches. Midstream, manufacturers design and integrate different configurations such as spread mooring, single point mooring (SPM), turret mooring and dynamic positioning-assisted mooring based on site conditions. Downstream, marine mooring systems are widely applied in ports and terminals, offshore oil & gas platforms, floating production units (FPSO/FLNG), offshore wind installations and aquaculture facilities, forming a critical safety infrastructure that ensures station keeping, operational continuity and asset protection in marine environments.
