A turbocharger, colloquially known as a turbo, is a turbine-driven forced induction device that increases an internal combustion engine's efficiency and power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is due to the fact that the compressor can force more air—and proportionately more fuel—into the combustion chamber than atmospheric pressure (and for that matter, ram air intakes) alone. Marine and ship turbocharger are easy to process, assemble, repair and maintain for the larger Marine turbochargers, in addition, the integral structure of the floating sleeve shortens the overall length of the supercharger and reduces the number of spare parts It simplifies the structure.
