The global Marine Power Battery market size is predicted to grow from US\$ 880 million in 2025 to US\$ 1558 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Marine Power Battery refers to a rechargeable battery system designed to provide propulsion power or auxiliary power for electric and hybrid vessels. It usually uses lithium-ion, lithium iron phosphate, or other marine-certified battery technologies, combined with battery management systems, thermal management, fire protection, power distribution, and monitoring modules. Compared with ordinary industrial batteries, marine power batteries must meet stricter requirements for vibration resistance, corrosion resistance, waterproofing, safety redundancy, and classification certification. They are widely used in electric ferries, workboats, yachts, inland vessels, offshore support vessels, and hybrid propulsion systems. The industrial chain of Marine Power Battery includes upstream suppliers of battery cells, cathode materials, anode materials, electrolytes, separators, battery management systems, thermal management components, connectors, enclosures, fire protection systems, and power electronics. Midstream activities include module assembly, battery pack integration, marine safety design, system testing, certification, software control, and vessel power system integration. Downstream applications mainly include electric ferries, inland transport vessels, harbor vessels, offshore service vessels, yachts, fishing vessels, and hybrid propulsion ships. Installation, commissioning, maintenance, remote monitoring, safety inspection, and lifecycle recycling services support long-term operation and compliance. In 2025, global Marine Power Battery production reached approximately 20,000 units, with an average global market price of around US\$45,000 per unit. The gross profit margin of major companies in the industry is between 30%-50%. In 2025, the global production capacity of marine power battery systems was approximately 26,667 units.

The development trend of marine power batteries is moving towards higher energy density, faster charging speed and longer service life. With the increasing global attention to environmental protection and the increasingly stringent emission standards of the International Maritime Organization (IMO), electrification has become one of the important development directions of the shipping industry. In the future, marine power batteries will be more integrated with intelligent management systems to achieve real-time monitoring and optimization of battery status, improve energy efficiency and extend battery life. In addition, the research and development of new generation battery technologies such as solid-state batteries is expected to further enhance the safety and performance of batteries, accelerate the electrification process of ships, and expand their application potential in long-distance shipping. At the same time, the improvement of supporting infrastructure such as shore power facilities will also promote the popularization and development of marine power batteries and help the global shipping industry transform to green and low-carbon. These advances not only improve the environmental friendliness of ship operations, but also provide a solid foundation for the construction of future intelligent shipping systems.
