The report requires updating with new data and is sent in 48 hours after order is placed.

A marine seismic source is a device used in underwater seismic surveys to generate controlled energy waves, which penetrate the seabed and reflect back to sensors. This data helps in mapping and analyzing subsurface geological structures, essential for oil and gas exploration, geological research, and environmental studies. Common types of marine seismic sources include air guns, water guns, and sparkers, which release bursts of compressed air, water, or electrical energy, respectively. These sources are deployed from vessels and synchronized to produce clear, high-resolution images of the seafloor and underlying strata. Their precise control and powerful output make them crucial tools for gathering accurate geological information in marine environments.

The global Marine Seismic Source market size is projected to grow from US\$ 456 million in 2024 to US\$ 687 million in 2030; it is expected to grow at a CAGR of 7.1% from 2024 to 2030.
