## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A marine thrust block is a special kind of thrust bearing used in large ship engines to resist the thrust generated by the propeller shaft and transfer the generated energy to the hull of ship. It is also known as a thrust box. Marine thrust blocks contain many wedge-shaped white metal pads that are fixed on a steel support and form a case. The main purpose of these blocks is to transfer the torque generated by the propeller to the hull of the ship through the metal housing. At the bottom of the housing, there is an oil reservoir that contains an oil-cooling coil, which circulates sea water. The pads available in the housing protect the fluid film of the oil reservoir from overheating and wear and tear, which may occur by the rotational movement of the drive shaft.

The global Marine Thrust Blocks market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
