## Abstracts

The global Marine Urea Solution market size is predicted to grow from US\$ 534 million in 2025 to US\$ 706 million in 2032; it is expected to grow at a CAGR of 4.2% from 2026 to 2032.

By 2024, global Marine Urea Solution production is expected to reach 1,196,000tons, with an average selling price of US\$437 per ton. The industry average gross profit margin is approximately 34%.

Marine urea solution is a high-purity urea aqueous solution specifically designed for marine selective catalytic reduction (SCR) systems. Its main components are high-purity urea and deionized water. Its function is to reduce nitrogen oxides (NO<sub>x</sub>) emitted from marine diesel engines into harmless nitrogen (N<sub>2</sub>) and water, thereby meeting emission standards set by the International Maritime Organization (IMO) (such as IMO Tier III standards).

The upstream of the industry chain mainly consists of high-purity urea (prill/granular urea, etc., from urea producers/traders) + deionized/EDI water, as well as packaging and cross-port logistics resources such as IBC/ISO TANK/tank trucks; the midstream involves the allocation and filling, batch testing and traceability system around ports or in the region (ensuring compliance with ISO impurity limits and concentration requirements), and delivery of products to 'port tank farms/ships' through storage tank farms and ship supply operations; the downstream mainly targets the operation and management companies of newly built or converted ships (merchant ships, ro-ro passenger ships, inland waterway vessels, etc.) equipped with SCR, with demand increasing with the scope and implementation of IMO Tier III in NO<sub>x</sub> ECA/NECA regions, and usage is strongly correlated with operating conditions.

The global marine urea supply chain begins with large chemical companies (such as

Yara and CF Industries) and manufacturers relying on fertilizer bases (especially in China), with their synthetic ammonia and urea production capabilities as the core. The products are delivered to dedicated storage tanks in major port hubs around the world by road, rail and coastal shipping. Finally, they are sold to passing ships by port filling stations, fuel suppliers or traders in the form of barrels or bonded warehouse barges. Its circulation is highly dependent on shipping routes, environmental regulations (such as the IMO sulfur limit/nitrogen oxide emission control area) and port infrastructure layout.

Factors influencing the demand for marine urea solutions include the growth of the maritime transportation industry, stricter emission norms, government initiatives promoting sustainable shipping practices, and rising awareness about environmental protection. Additionally, the development of advanced SCR technologies and the expansion of infrastructure for the production, storage, and distribution of marine urea solutions also contribute to the market growth.

The current market situation is characterized by 'standardized products + servitized delivery': the products themselves are relatively homogeneous, but price and competitiveness depend more on port coverage, delivery mode (bulk/IBC), quality and liability terms, and ship-to-ship supply capabilities. Future trends include NECA driving continued demand expansion, the supply chain shifting from 'single-point supply' to 'port networking and integrated warehousing and distribution,' and the emergence of more on-site or onboard AUS40 preparation or blending solutions for cost reduction and efficiency improvement (such as Urea Generator's approach of on-site AUS40 preparation according to ISO standards).
