A marine winch and a windlass are both mechanical devices used on ships for handling heavy loads, but they serve different purposes. A marine winch is designed for pulling, lifting, or mooring operations, commonly used for anchoring, towing, and cargo handling. It consists of a drum, motor, and braking system to control tension and movement. A windlass, on the other hand, is specifically used for raising and lowering the anchor and anchor chain. It features a gypsy wheel that grips the chain and often includes a warping drum for additional mooring functions. While both devices aid in ship operations, the key difference is that a windlass is dedicated to anchoring, whereas a marine winch has broader applications in ship handling and cargo operations.
