Maritime exhaust gas aftertreatment systems are critical equipment or systems integrated into the exhaust systems of marine engines, designed to treat engine exhaust gases through physical, chemical, or biological methods to significantly reduce emissions of harmful substances, such as nitrogen oxides (NO_x), sulfur oxides (SO_x), particulate matter (PM), and other pollutants, thereby complying with stringent international and regional regulations, such as the International Maritime Organization's (IMO) Tier III emission standards. Their primary purpose is to protect marine and coastal ecosystems, mitigate the atmospheric pollution caused by ship operations, promote the sustainability of the maritime industry, and enhance corporate social responsibility and market competitiveness. By incorporating advanced technologies, these systems achieve comprehensive pollutant control, effectively reducing harmful emissions and improving air quality, while also optimizing engine performance to enhance fuel efficiency, minimizing carbon buildup and corrosion to extend engine lifespan, and enabling compliance with regulations to avoid penalties while boosting brand reputation and market standing. As environmental awareness grows and regulations become increasingly stringent, maritime exhaust gas aftertreatment systems are becoming ever more vital, serving as a cornerstone technology in advancing green shipping.
