The report requires updating with new data and is sent in 48 hours after order is placed.

Markerless motion capture system is a technology used to capture human motion. Unlike traditional Marker-based Motion Capture System, it does not require markers to be attached to the surface of the captured object (usually the human body) to track motion. Markerless Motion Capture System uses computer vision technology, depth cameras, sensors and other equipment to capture and reconstruct human movement in real time to generate high-quality animation or data. Such a system is generally more flexible because it does not require prior placement of markers on the object, but is typically more expensive and complex as it requires more computing resources and complex algorithms to analyze the images and data. Markerless Motion Capture System is widely used in many fields such as film and television production, sports science, medical research, etc.

The global Markerless Motion Capture System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
