The global Mask Cleaning Services market size is predicted to grow from US\$ 1851 million in 2025 to US\$ 2532 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Mask cleaning services refer to specialized technical services dedicated to the professional cleaning, contaminant removal, and surface maintenance of photomasks (or 'masks') utilized in the manufacturing processes of semiconductors, display panels, MEMS, and PCBs. The primary objective of these services is to eliminate defects such as particles, metallic contaminants, organic residues, photoresist residues, and oxides from the photomask surface, thereby ensuring the precision of lithographic exposure and manufacturing yield, while simultaneously extending the operational lifespan of the photomasks. Given that the pattern precision of masks in advanced manufacturing processes has reached the nanoscale, even minute contaminants can trigger exposure defects, circuit short circuits, or a decline in chip yield; consequently, photomask cleaning has emerged as a critical component of the lithography process.

In terms of demand structure, advanced semiconductor processes constitute the largest source of demand for photomask cleaning services, accounting for over 70% of the total market. As 5nm, 3nm, and future 2nm process technologies advance bringing mask pattern precision into the nanoscale even microscopic particles can lead to chip defects; consequently, the frequency of advanced mask cleaning continues to rise. Concurrently, growing demand for EUV lithography, High-NA EUV, advanced Chiplet packaging, and AI chips is driving a rapid expansion in the need for high-end photomask maintenance and cleaning. OLED/LCD display panels, MEMS devices, and high-end PCB exposure processes form the second tier of demand, with mask cleaning requirements related to Mini LED and Micro LED technologies exhibiting particularly

rapid growth.

Regarding product and technology roadmaps, the industry is currently transitioning from traditional wet chemical cleaning toward a paradigm characterized by 'non-destructive methods, automation, and EUV specialization.' Current mainstream technologies include megasonic cleaning, ultra-pure chemical cleaning, CO₂ snow cleaning, dry plasma cleaning, and ultra-pure water (UPW) cleaning. Given that EUV masks utilize multi-layer reflective films and protective pellicles, they impose extremely stringent requirements on cleaning processes; as a result, the industry is increasingly emphasizing low-damage techniques, minimal particle re-adhesion, and real-time defect monitoring capabilities. Moving forward, AI-driven defect recognition, automated mask management systems, and cleaning technologies compatible with High-NA EUV are poised to become key directions for industry upgrades.
