The global Mask Design Rule Check Services market size is predicted to grow from US\$ 1395 million in 2025 to US\$ 1889 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Mask Design Rule Checking (DRC) is an EDA and manufacturing support service dedicated to the verification of design rules and manufacturability for photomask layout data. Primarily utilized in the lithography processes for semiconductors, display panels, MEMS, and advanced packaging, this service ensures that mask layouts fully comply with the specific design rule requirements of wafer fabs, lithography equipment, and mask manufacturing processes. Its core function is to identify potential violations within the layout?such as issues regarding line width, spacing, overlap, angles, notches, density, and pattern topology?prior to mask fabrication, thereby preventing subsequent lithography failures, mask defects, or a decline in chip yield.

In terms of demand structure, advanced semiconductor processes constitute the largest source of demand for Mask DRC services; specifically, the 7nm, 5nm, 3nm, and future 2nm process nodes have led to a dramatic increase in the complexity of mask rule verification. Concurrently, EUV lithography, multi-patterning, advanced Chiplet packaging, and high-performance AI chips are also driving rapid growth in Mask DRC demand. While sectors such as OLED displays, MEMS devices, and high-density PCBs also generate some demand, their overall technical complexity remains lower than that of advanced semiconductors. With the advancement of AI servers, High-Performance Computing (HPC), and autonomous driving chips, Mask DRC has evolved from traditional layout rule checking into a critical component of advanced Design for Manufacturability (DFM) and hotspot analysis workflows.

Regarding product and technology roadmaps, the industry is currently upgrading from traditional geometric rule checking toward AI-assisted hotspot detection, EUV-specific rule verification, and large-scale parallel cloud-based verification. Modern advanced Mask DRC solutions are required to do more than simply check for minimum line widths, spacing, and overlay errors; they must now perform comprehensive verification that integrates OPC, EUV reflective masks, multi-patterning, and optical proximity effects. As High-NA EUV and Chiplet packaging technologies advance, the volume of Mask DRC rules and the associated computational workload are expanding rapidly, prompting EDA platforms to increasingly adopt GPU acceleration, distributed computing, and AI-driven automated repair recommendation technologies. In the future, Mask DRC is expected to achieve even deeper integration with OPC, lithography simulation, and DFM platforms.
