Photolithography is the standard manufacturing technique used for micro-patterning of electronic circuits, as well as other devices such as micro-electromechanical systems (MEMS) and micro-fluidics. Maskless lithography (MPL) is a photomask-less photolithography-like technology used to project or focal-spot write the image pattern onto a chemical resist-coated substrate (e.g. wafer) by means of laser or electron beam. Mask-free processes have been developed for rapid prototyping, such as laser direct-writing and scanning electron-beam lithography.
