The global Mass Spectrometry Grade Methanol market size is predicted to grow from US\$ 141 million in 2025 to US\$ 192 million in 2032; it is expected to grow at a CAGR of 4.6% from 2026 to 2032.

Mass spectrometry grade methanol is a high-purity solvent processed using a special purification process, achieving extremely high chemical purity (typically >99.9%). It is strictly controlled for non-volatile residues (NVR), metal ions, particulate matter, and ultraviolet (UV) absorption impurities. Its most critical characteristic is that it must be filtered through a 0.1µm or 0.2µm microporous membrane and bottled in specialized low-particle-leaching vials, ready to use immediately after opening without requiring further filtration by the user.

The upstream of the methanol industry chain mainly includes basic chemical raw materials (coal chemical/natural gas-to-methanol route), distillation and ultrapure purification equipment for high-purity solvent purification (such as multi-stage distillation columns and molecular sieve dehydration systems), high-cleanliness packaging materials, and metal ion adsorption and filtration media. The midstream involves the production and packaging of high-purity analytical-grade methanol. Through multi-stage distillation, ultra-low metal control, ultra-clean filling, and a strict quality control system, industrial-grade methanol is upgraded to ultra-high-purity solvent products that meet LC-MS detection requirements. The downstream is widely used in mass spectrometry-related detection systems, including high-end analytical testing fields such as drug development and metabolic analysis, proteomics and metabolomics research, clinical testing, biomarker detection, and environmental and food safety analysis.

In 2025, global mass spectrometry grade methanol sales reached 2.22 million liters,

with a production capacity of approximately 3.17 million liters, an average selling price of \$65/liter, and an average gross profit margin of 40%-50%.

The increasing reproducibility requirements of global regulatory systems (FDA, EMA, ICH) for drug analysis data have indirectly promoted the widespread adoption of LC-MS methods, thereby driving growth in demand for high-purity solvents. Simultaneously, biomedical innovation policies (such as gene therapy, ADC drugs, and precision medicine) are propelling mass spectrometry analysis into the standard tool. In terms of industry dynamics, the high concentration of the supply chain has resulted in relatively stable solvent prices, but a premium exists for high-end products. In recent years, the trends of green chemistry and sustainable laboratory development have driven the development of low-solvent consumption and recycling systems, which have somewhat curbed unit usage but increased the proportion of high-end products.
