The main site security gateway is a security device located at the network border, used to protect the network security of the main site (also called the core site) of an enterprise or organization. The master station security gateway can provide comprehensive security protection through centralized management and control of network traffic, preventing network attacks, data leakage and the spread of malware. The main site security gateway usually has the following functions: 1. Firewall: The main site security gateway can set network access control policies to prevent unauthorized access and intrusion, and protect the main site from network attacks. 2. Intrusion detection and defense: The main site security gateway can detect and block various network attacks, such as DDoS attacks, SQL injection, etc., to protect the network and system security of the main site. 3. Virtual Private Network (VPN): The security gateway of the main site can provide the VPN function, allowing remote users to safely access the network resources of the main site, while protecting the confidentiality and integrity of data. 4. Proxy server: The main station security gateway can act as a proxy server to filter and monitor network traffic to prevent the spread of malware, viruses and malicious links. 5. Data encryption and decryption: The master station security gateway can encrypt and decrypt network traffic to ensure the confidentiality and integrity of data during transmission. 6. Security auditing and logging: The master site security gateway can record and audit network traffic and security events, provide real-time monitoring and reporting, and help enterprises discover and respond to security threats in a timely manner. The main site security gateway is an important part of the network security architecture of an enterprise or organization. By protecting the network and system

security of the main site, it can ensure that the core business of the enterprise can run safely and stably.
