Material separation nanofiltration membrane is an advanced membrane separation technology, widely used in water treatment, food and beverage processing, pharmaceutical manufacturing and chemical industry. Nanofiltration membranes have a unique pore size structure, with pore sizes usually between 1 and 10 nanometers, which can effectively intercept solutes with molecular weights in the range of 200-1000 daltons, while allowing water molecules and some smaller ions to pass through. This selective separation property makes nanofiltration membranes excellent when handling solutions containing organic matter, metal ions, and other impurities.

The global Material Separation Nanofiltration Membrane market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
