The global Materials for Next-generation Lithography market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Next-generation lithography refers to advanced techniques and materials used in semiconductor manufacturing to create smaller and more intricate patterns on semiconductor wafers. These technologies are essential for producing higher-performance and more power-efficient integrated circuits.

The market for materials used in Next-generation Lithography was experiencing significant growth, driven by the semiconductor industry's demand for advanced lithography technologies to enable smaller and more powerful semiconductor devices. The semiconductor industry's constant push to create smaller and more intricate patterns on silicon wafers drove the need for advanced lithography materials and technologies. As semiconductor manufacturers moved to smaller process nodes (e.g., 7nm, 5nm, and below), they required materials that could enable higher resolution and pattern fidelity. The increasing adoption of Extreme Ultraviolet (EUV) Lithography, which uses shorter wavelengths of light to print smaller features, led to the demand for specialized materials for EUV photomasks and other components. The market for materials used in Next-generation Lithography was a global one, with key regions being North America, Europe, Asia-Pacific, and the rest of the world. The presence of major semiconductor manufacturers and leading lithography equipment companies in these regions influenced the demand for lithography materials.
