Recognizing the limitations of traditional adaptive headlights, matrix LED lighting systems have been developed to provide intelligent front lighting with dynamic control and split-second beam adaption in response to changing driving conditions. Although matrix LED headlight systems demand sophisticated engineering, they work on a very straightforward principle of operation - pixel-level digital control over the high beam. Unlike gas burning and arc type lamps, LEDs are semiconductor devices which produce photon flux (light) by passing an electric current through a p-n junction biased in the forward direction. Light intensity can be dynamically and precisely controlled by regulating the current flow through the LEDs. These semiconductor diodes can be instantly activated and require no warm up time. The ability to withstand tens of thousands switch cycles reinforces LED's application advantage in digital lighting system. Excellent dimmability lends LED headlight modules unprecedented versatility. High beam LEDs can be dimmed down to take the role of daytime running lights. Moreover, LED's compact form factor, solid state nature as well as flexibility in optical control offer incomparable design freedom and engineering applicability in smart ADB systems.
