The global Maxillary Distractor market size is predicted to grow from US$ 74.1 million in 2025 to US$ 97 million in 2031; it is expected to grow at a CAGR of 4.7% from 2025 to 2031.

The Maxillary Distractor is intended for use in craniofacial surgery, reconstructive procedures, and selective orthognathic surgery of the maxilla. Specifically, it is intended for distraction of the maxilla utilizing a LeFort I osteotomy in adult and pediatric populations.

A maxillary retractor is an instrument used to treat maxillary deformities or maxillary fractures. It is usually made of metal and is implanted into the bone in the upper jaw. Its main function is to achieve the traction and expansion of the maxilla by gradually separating the maxillary bone, so as to achieve the purpose of correcting maxillary deformity, increasing the width of the maxilla or restoring maxillary fractures. A maxillary retractor is a commonly used surgical tool that can be used in oral and maxillofacial surgery, orthognathic surgery, or maxillofacial reconstruction. After the operation, the doctor will make regular adjustments and gradually change the setting of the retractor so that the maxillary bone gradually returns to the expected position and shape.
