The global Mechanical Decanter market size is predicted to grow from US$ 924 million in 2025 to US$ 1231 million in 2031; it is expected to grow at a CAGR of 4.9% from 2025 to 2031.

The mechanical decanter is one of the key equipment in sewage treatment processes such as SBR (intermittent activated sludge process). The mechanical decanter is a device that realizes the drainage function through a mechanical structure. It usually has a sturdy bracket and drive device, which can withstand various stresses during work. In the SBR process, the mechanical decanter is designed to remove clarified water from the static pool surface without stirring the sediment, thereby ensuring the effluent water quality. The structure of the mechanical decanter is relatively complex, usually including an adjustable weir and an associated mechanical transmission system. The weir is used to control the height and drainage speed of the drain port, while the mechanical transmission system is used to drive the up and down movement of the weir. In addition, the mechanical decanter may also be equipped with an automatic control device to achieve precise control of the decanting process.

United States market for Mechanical Decanter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
